

Q21 Important features of the post ER defect

Answered: 12 Skipped: 0

#	RESPONSES	DATE
1	-Target signs -Areas of poor chromic dye uptake	1/13/2018 6:29 AM
2	Normal pit pattern of the borders/residual adenoma Pulsating vessles target sign	12/7/2017 5:46 PM
3	Please see the answer to the question above	12/3/2017 9:47 PM
4	* scar/fibrotic tissue * sometimes resembles an adenomatous remnant * post clip artifacts	11/18/2017 9:34 PM
5	Wide resection margin No visible polyp by HDWL + NBI	11/14/2017 6:05 AM
6	1. Clear margins 2. No propia defect 3. Uniformed stained submucosa	11/13/2017 1:38 PM
7	Post ER defect should be inspected for and ensure the lack of the following: a. residual polyp b. mural injury c. perforation d. active bleeding e. large blood vessels that may require coagulation	11/5/2017 3:06 PM
8	1. No evidence of DMI 2. No evidence of residual adenomatous tissue either at the margins or within the defect	11/5/2017 3:13 AM
9	blend surface, versus presence of residual tissue.	11/3/2017 2:57 PM
10	assessment of margins - blue light/dye. Appreciation of muscle injury appreciation of submucosal haematoma appreciation of any significant vessels that might need coagulation/clipping - non bleeding pulsating arterioles	11/3/2017 12:39 PM
11	Areas of non-staining (initial), areas of oozing, small remainder of adenoma in center or at edges.	11/1/2017 11:39 AM
12	Clear margins. Intact (blue) muscle layer. No muscle burn. No active bleeding. Absence of white spots - fibrous or invasion	10/31/2017 10:57 PM
